

ComplyBean

PRE-PRODUCTION QUALITY ASSURANCE

Website testing report

Comprehensive functional, responsive, performance, accessibility, security, SEO, deployment, and live-domain validation for the ComplyBean marketing website.

PREPARED

01 August 2026

RELEASE TESTED

f961c72

ENVIRONMENT

GitHub Pages / Production

Conditional launch approval

The public site is operational, deploys successfully, and has no confirmed functional, accessibility, or dependency-security failure. It is suitable for continued use and stakeholder review. Before treating it as fully marketing-launch ready, resolve the SEO and mobile-asset findings below.

6/6

PUBLIC ROUTES LIVE AND RETURNING 200

100

ACCESSIBILITY SCORE, MOBILE & DESKTOP

83

MOBILE LIGHTHOUSE PERFORMANCE SCORE

Release decision

AREA	DECISION	REASON
Functional release	PASS	Static build, navigation, mobile menu, keyboard behavior, images, email links, live routes, and 404 behavior work as expected.
Accessibility release	PASS	Lighthouse accessibility score is 100 in both profiles; keyboard and skip-link behavior were exercised in Firefox.
Security baseline	PASS	HTTPS, HSTS, valid TLS certificate, no exposed client secrets/debug patterns, and no known production dependency vulnerabilities.
SEO / discoverability	CONDITIONAL	Canonical URLs are wrong on subpages; sitemap and robots files are missing; social metadata is incomplete.
Mobile performance	IMPROVE	An oversized logo PNG causes approximately 1.2 MB of avoidable mobile transfer.

Scope note: This is a static marketing site with an email contact action. There are no accounts, forms, payments, checkout, APIs, databases, authentication, or server-side CRUD flows to validate.

What was tested

Application under test

- Next.js 16.2.12 static export with GitHub Pages deployment.
- Seven generated routes: home, About, How It Works, Platform, What We Do, Who It's For, and 404.
- One client-side mobile navigation component and email-based contact links.
- Custom domain: <https://complybean.com>.

Test environments

- Production build: `next build --webpack`, limited to two workers.
- Chrome Lighthouse 12.8.2: desktop and Android Chrome emulation (412×823).
- Firefox headless: keyboard, navigation, image, and responsive checks.
- Live GitHub Pages domain, GitHub Actions API, DNS, TLS, and HTTP headers.

Test coverage matrix

CHECKLIST CATEGORY	COVERAGE	RESULT
Functional testing	Routes, navigation, mobile menu, Escape behavior, skip link, mailto actions, images, 404.	PASS
Cross-browser / device	Chrome desktop + Android emulation; Firefox at five widths. Safari/Edge and physical devices unavailable.	PASS WITH LIMITS
Performance	Desktop and mobile Lighthouse; asset transfer review; light concurrency smoke test.	IMPROVE
Security	HTTPS/TLS/HSTS, public headers, dependency audit, source scan.	PASS
Accessibility	Lighthouse, keyboard focus, skip link, labels, image alternatives.	PASS
SEO / metadata	Titles, descriptions, canonicals, indexing, Open Graph, robots, sitemap, structured data.	CONDITIONAL
Automated testing	CI lint, type-check, and production build. No unit or E2E suite exists.	GAP

Explicitly not applicable

Signup/login, checkout, payments, form validation, CRUD, database query profiling, API rate limiting, CSRF, authorization boundaries, third-party payment/email APIs, and backend load testing are not present in this release.

Functional, navigation, and UI QA

TEST	EVIDENCE	OUTCOME
Production compile	ESLint, TypeScript, and optimized static build completed; all seven generated routes listed by Next.js.	PASS
Route availability	Local export and live domain returned successful responses for /, /about/, /how-it-works/, /platform/, /what-we-do/, and /who-its-for/.	PASS
Broken links and assets	23 internal references validated in the static output. All visible images completed with a non-zero natural width.	PASS
Content structure	One H1 per public page; no duplicate IDs; title and description tags present; no placeholder/lorem/debug references in app code.	PASS
Mobile navigation	Firefox: menu opened, Escape closed it, and the About link navigated successfully.	PASS
Keyboard path	First Tab focuses the "Skip to main content" link; focusable controls expose accessible labels.	PASS
Email actions	2–3 mailto links available per page as designed. Client does not submit or store user data.	PASS
Not-found response	Live missing path returned HTTP 404 with the generated not-found page title.	PASS

Responsive matrix

30 FIREFOX ROUTE / VIEWPORT CHECKS	0 HORIZONTAL OVERFLOW FAILURES	0 BROKEN-IMAGE FAILURES
--	--	---

Firefox exercised all six public routes at 500, 768, 1024, 1440, and 1920 px. Chrome Lighthouse also provided true Android Chrome emulation at 412×823; headline wrapping, CTAs, menu access, and visual containment passed visual inspection.

Performance profile

PROFILE	PERFORMANCE	ACCESSIBILITY	BEST PRACTICES	SEO	KEY TIMINGS
Desktop	99	100	100	100	LCP 0.9 s · CLS 0 · TBT 0 ms · Speed Index 0.3 s
Mobile (simulated)	83	100	100	100	LCP 4.7 s · CLS 0 · TBT 10 ms · Speed Index 1.4 s

Primary performance finding

compliance-mark.png is a 1.27 MB, 1536×1024 PNG that is displayed around 144 px in the homepage visual.

Lighthouse estimates roughly **1.2 MB** of avoidable transfer. Convert it to WebP/AVIF and provide appropriately sized variants; do not preload the full-resolution source unnecessarily.

Additional observations

- Total observed mobile page transfer: 1.867 MiB.
- Estimated unused JavaScript: 172 KiB (mostly shared Next.js runtime bundles).
- CSS: about 44.7 KiB; no unused-CSS opportunity was reported.
- Mobile LCP element was the hero H1; simulated render delay dominated the metric.

Light concurrent-request smoke test

REQUESTS	CONCURRENCY	SUCCESS	AVERAGE	P95	MAXIMUM
30	5	30 / 30 HTTP 200	99 ms	296 ms	304 ms

This is a safe light-load smoke test, not a capacity or DDoS benchmark. GitHub Pages is a static CDN-backed host, so database and application-server load tests do not apply.

Security baseline

CHECK	EVIDENCE	OUTCOME
Transport security	HTTP apex redirects 301 to HTTPS; www redirects 301 to HTTPS apex. HSTS: max-age=31556952.	PASS
TLS certificate	Let's Encrypt certificate; SAN includes complybean.com and www.complybean.com; valid 29 Jul–27 Oct 2026.	PASS
Dependency audit	<code>pnpm audit --prod --audit-level moderate</code> : no known vulnerabilities.	PASS
Client source scan	No <code>dangerouslySetInnerHTML</code> , <code>eval</code> , debug logs, localhost references, or environment-variable exposure found in app source.	PASS
Attack surface	No user input, authentication, server API, storage, database, payment, or form submission surface in this static release.	NOT APPLICABLE
Security headers	HSTS is present. CSP, Referrer-Policy, and X-Content-Type-Options are not supplied by the current GitHub Pages configuration.	RECOMMEND

Accessibility

Automated result

Lighthouse accessibility: 100 / 100 in both desktop and mobile profiles.

- Alt attributes present on all rendered images.
- One H1 per route and no duplicate IDs.
- Interactive controls include labels and visible focus handling.

Manual browser checks

- Keyboard focus begins at the skip link.
- Menu operates by keyboard and closes with Escape.
- Reduced-motion CSS disables transitions and animation durations.
- Visual inspection found no obvious clipping at tested breakpoints.

Not performed: NVDA, VoiceOver, or a manual screen-reader reading-order review.

Search and social metadata

CHECK	FINDING	PRIORITY
Titles and descriptions	Present on all public pages. Page titles are route-specific.	PASS
Canonical URLs	Defect: every internal page currently outputs <code>https://complybean.com/</code> as its canonical, including About, Platform, and How It Works.	HIGH
Robots and sitemap	Missing: live <code>/robots.txt</code> and <code>/sitemap.xml</code> both return 404.	HIGH
Open Graph / Twitter	All subpages inherit the homepage social title. No <code>og:image</code> is set.	MEDIUM
Structured data	No JSON-LD/schema.org payload found.	MEDIUM
Indexing	Public pages are indexable; generated 404 is marked noindex.	PASS

Production configuration

CHECK	EVIDENCE	OUTCOME
Deployment	GitHub Actions workflow ran successfully for commit f961c72.	PASS
CI quality gate	Frozen install, lint, TypeScript type-check, static build, and GitHub Pages deployment are configured.	PASS
CPU / memory protection	Next.js static generation is capped at two workers. Local production checks completed in approximately 10–11 seconds.	PASS
Monitoring / analytics	No analytics, error monitoring, or uptime monitoring integration was detected.	OPTIONAL
Rollback	Git history plus GitHub Pages deployment workflow support a rollback by reverting/redeploying a known-good commit.	READY

Prioritized remediation plan

1 Correct page-level canonical metadata

Give every route its own canonical URL. The current site tells search engines that all pages are duplicates of the homepage.

2 Add robots.txt and sitemap.xml

Publish the public route inventory and submit the sitemap in Google Search Console/Bing Webmaster Tools.

3 Optimize the ComplyBean mark

Export appropriately sized WebP/AVIF variants, update the displayed logo references, and retest mobile LCP. This is the highest-value performance improvement.

4 Complete social and structured metadata

Set each page's Open Graph/Twitter title, description, and sharing image; add Organization/WebSite JSON-LD if appropriate.

5 Add automated browser smoke tests to CI

At minimum, assert route availability, no overflow, no broken images, skip-link focus, and mobile menu behavior on every deployment.

6 Optional production hardening

Consider uptime monitoring, error tracking, analytics consent strategy, and a custom-header capable edge layer if CSP and additional security headers are required.

Evidence links

- Production site: <https://complybean.com>
- Successful deployment: [GitHub Actions run 30697372605](#)
- Repository: github.com/complybean/company-website

Final recommendation: approve the site for functional use now, but schedule the two SEO corrections and logo optimization before a broad acquisition, press, or search-indexing campaign.
